

Outline - APPM 5460 Proposal Outline

Luke Bury & Don Kuettel

March 20, 2018

0.1 needs

- 2-4 pages
- Lit review
- dynamical system modeled by ordinary differential equations
- material from class

0.2 outline

- Intro (don)
 - In this proposal, we will be investigating homoclinic orbits in the Circular Restricted Three-Body Problem
 - (tie to competition history)
 - Homoclinic orbits are ...
 - They are important because ...
- History w/ Lit Review (luke)
 - As documented by Andersson and Barrow-Green [1, 2], in 1885, Acta Mathematica announced a mathematics competition to the world. This competition, sponsored by King Oscar II of Sweden, encouraged interested parties to make an attempt at solving one of four selected problems.
 - Henri Poincaré, a prominent mathematician of the time (who was largely favored to win the competition) chose to attempt the first problem, which essentially asked for a solution to the n-body problem. However, instead of the n-body problem, Poincaré decided to first attempt the three-body problem, since it was the first order of the problem that remained unsolved. To further simplify his initial effort, he restricted the three-body system in a manner known today as the Circularly Restricted Three Body Problem (CR3BP).

Figure 1: Layout of Circular Restricted Three Body Problem [3]

- In the CR3BP, the origin is set at the barycenter of two bodies of interest (eg, Earth & Moon), and the frame rotates so these bodies remain stationary on the x-axis. The bodies are assumed to move in perfectly circular orbits, and act as point masses from a gravitational perspective. The system is normalized so that the masses of the two bodies sum to 1 ($m_1 = \mu$, $m_2 = 1 - \mu$), the distance between the bodies is 1, and the gravitational constant G is equal to 1.
- Under these conditions, the equations of motion for the CR3BP are:

$$\ddot{x} = 2\dot{y} + x - (1 - \mu) \left(\frac{x + \mu}{R_1^3} \right) - \mu \left(\frac{x - 1 + \mu}{R_2^3} \right) \quad (1)$$

$$\ddot{y} = -2\dot{x} + y \left(-\frac{1 - \mu}{R_1^3} - \frac{\mu}{R_2^3} + 1 \right) \quad (2)$$

$$\ddot{z} = z \left(-\frac{1 - \mu}{R_1^3} - \frac{\mu}{R_2^3} \right) \quad (3)$$

- Poincar submitted his work on the CR3BP, won the competition, and collected the prize. However, around the of some of the first printings of his work, a discussion with Lars Edvard Phragmn led to the discovery of an error within Poincar's submission that held significant ramifications.

- Application w/ Lit Review

- Much research has been conducted in this field since (references, references, references)
- (pg 72+ of book)

- we will look at / recreate Poincar’s work
- we will create homoclinic orbits in the CR3BP using intersections of stable and unstable orbits in Poincar plots
